

Moran scatterplots: High-quality development (Y)

● HH: High-high ■ LL: Low-low ▲ HL: High-low ▼ LH: Low-high ○ Not significant

31 provinces in each panel

Fixed row-standardized contiguity weights

Hainan linked to Guangdong

Identical axis ranges across years

Gray points can occur in any quadrant.

Line slope = global Moran's I; panel p = original global permutation p_sim (999 permutations).

Point colors/shapes show local p_sim < 0.05 classifications, unadjusted for multiple testing.

Quadrant position alone does not establish local significance; all values are standardized within each year.
